Bone is the rigid, hard connective tissue that comprises the majority of the skeleton in humans. It is a living, growing tissue that turns over at a rate of about 10% a year. Bone markers are blood and urine tests that detect products of bone remodeling to help determine if the rate of bone resorption and/or formation is abnormally increased, suggesting a potential bone disorder.

The bone, once formed, is maintained dynamically through two different processes, modeling and remodeling, which are also employed in bone fracture recovery. In bone modeling process, the new bone is formed without prior bone resorption, while in the bone remodeling process, bone formation follows bone resorption. Bone modeling is vigorous during growth, altering the shape and size of the bone.
